I worked alone on this project, so no work needed to be divided.

There were no optimizations needed to be made for this part of the project. I did, however, add error outputs if the table was not able to be made or if the load file could not be read. For example, if an invalid file path was input as the load file, the program would output an error.

Aside from adding errors, only what was expected from the specs was done. The index option is not yet initialized for part A.
